Why are you having these past life dreams? If we have a past life dream once or twice, it's usually just our sub-conscious bringing forth memories that stood out, such as happy or life-changing occasions. When we start having the same dream more often however, there is more than likely an unresolved issue in our present life that is similar, or that needs to be resolved.

A strikingly illustrated overview of the computing machines that have changed our world--from the abacus to the smartphone--and the people who made them, by the New York Times bestselling author and illustrator of *Women in Science*. Computers are everywhere and have impacted our lives in so many ways. But who created them, and why? How have they transformed the way we interact with our surroundings and each other? Packed with accessible information, fun facts, and discussion starters, this charming and art-filled book takes you from the ancient world to the modern day, focusing on important inventions from the earliest known counting systems to the sophisticated algorithms behind AI. *The History of the Computer* also profiles a diverse range of key players and creators--from An Wang and Margaret Hamilton to Steve Jobs and Tim Berners-Lee--and illuminates their goals, their intentions, and the impact of their inventions on our everyday lives. This entertaining and educational journey will help you understand our most important machines and how we can use them to enhance the way we live. You'll never look at your phone the same way again!

This book explains why AI is unique, what legal and ethical problems it could cause, and how we can address them. It argues that AI is unlike any other previous technology, owing to its ability to take decisions independently and unpredictably. This gives rise to three issues: responsibility--who is liable if AI causes harm; rights--the disputed moral and pragmatic grounds for granting AI legal personality; and the ethics surrounding the decision-making of AI. The book suggests that in order to address these questions we need to develop new institutions and regulations on a cross-industry and international level. Incorporating clear explanations of complex topics, *Robot Rules* will appeal to a multi-disciplinary audience, from those with an interest in law, politics and philosophy, to computer programming, engineering and neuroscience.

We live at a time when the human lifespan has increased like never before. As average lifespans stretch to new lengths, what impact should this have on our values? Should our values change over the course of our ever-increasing lifespans? Nancy S. Jecker coins the term, the life stage relativity of values, to capture the idea that at different stages of our lives, different ethical concerns shift to the foreground. During early life, infants and small children hold dear the value of being cared for and nurtured by someone they trust--and their vulnerability and dependency make these the right values for them. By early adulthood and continuing into midlife, the capacity for greater physical and emotional independence gives people reason to place more emphasis on autonomy and the ability to freely choose and carry out their plan of life. During old age, heightened risk for chronic disease and disability gives us a reason to shift our focus again, emphasizing safeguarding our central capabilities and keeping our dignity and self-respect intact. Despite different values becoming central at different stages of life, we often assume the standpoint of someone in midlife, who is in the midst of planning a future adulthood that stretches out before them. Jecker coins the term, midlife bias, to refer to the privileging of midlife. Midlife bias occurs when we assume that autonomy should be our central aim at all life stages and give it priority in a wide range of ethical decisions. The privileging of midlife raises fundamental problems of fairness. It also suggests the possibility of large gaps in the ethical principles and theories at hand. *Ending Midlife Bias: New Values for Old Age* addresses these concerns in a step-wise fashion, focusing on later life. Jecker first introduces a philosophical framework that extends moral theorizing to older adults, addressing midlife bias, the life stage relativity of values, human capabilities and dignity, time's passage, the narrative self, and justice between old and young. She then turns to policy and practice and explores ethical issues in bioethics, long term care, personal robotic assistants, care of the dying and newly dead, ageism in medical research, the allocation of healthcare, mandatory retirement, and the future of population aging.

'A compelling invitation to imagine the future we want' —BRIAN CHRISTIAN, author of *The Most Human Human* By 2062 we will have built machines as intelligent as us - so the leading artificial intelligence and robotics experts predict. But what will this future look like? In 2062, world-leading researcher Toby Walsh considers the impact AI will have on work, war, economics, politics, everyday life and even death. Will automation take away most jobs? Will robots become conscious and take over? Will we become immortal machines ourselves, uploading our brains to the cloud? How will politics adjust to the post-truth, post-privacy digitised world? When we have succeeded in building intelligent machines, how will life on this planet unfold? Based on a deep understanding of technology, *2062* describes the choices we need to make today to ensure that the future remains bright. 'Clarity and sanity in a world full of fog and uncertainty - a timely book about the race to remain human.' —RICHARD WATSON, author of *Digital Vs. Human* and futurist-in-residence at Imperial College, London 'One of the deepest questions facing humanity, pondered by a mind well and truly up to the task.' —ADAM SPENCER, broadcaster

Sir Anthony Seldon, the prominent political biographer and leading educationalist, addresses one of the high-stakes issues that will influence our future: the role of artificial intelligence and its impact on education. The use of AI promises an altogether new way of educating, offering learners from all backgrounds widespread access to personalised tuition and digital educational materials from across the world. Educational institutions across the world have been impacted by the COVID-19 pandemic and many have migrated, at least temporarily, to online platforms. The debate about how to deliver knowledge has never been more relevant. Many countries have an excellent education system with their schools and universities - excellent, but tailored to the twentieth century. The mass teaching methods of the third revolution era have failed to conquer enduring problems of inequity and lack of individualised learning. AI is disrupting the way we live, work and interact with the environment, and we cannot stop it changing our schools and universities. But we have time - albeit not for long - to shape this revolution. It will not be a panacea, and if we are not quick, it will start to replace what makes us human - being creative, having beliefs, and loving others. This book, presented in considerably updated and extended second edition, is a call to educators everywhere to open their eyes to what is coming. If we do so, then the future will be shaped by us for the common interests of humanity - but if we don't, then it will be imposed, and we will all lose.

Artificial Intelligence and Global Security: Future Trends, Threats and Considerations brings a much-needed perspective on the impact of the integration of Artificial Intelligence (AI) technologies in military affairs. Experts forecast that AI will shape future military operations in ways that will revolutionize warfare.

Autonomous weapons systems seem to be on the path to becoming accepted technologies of warfare. The weaponization of artificial intelligence raises questions about whether human beings will maintain control of the use of force. The notion of meaningful human control has become a focus of international debate on lethal autonomous weapons systems among members of the United Nations: many states have diverging ideas about various complex forms of human-machine interaction and the point at which human control stops being meaningful. In *Autonomous Weapons Systems and International Norms* Ingvild Bode and Hendrik Huelss present an innovative study of how testing, developing, and using weapons systems with autonomous features shapes ethical and legal norms, and how standards manifest and change in practice. Autonomous weapons systems are not a matter for the distant future – some autonomous features, such as in air defence systems, have been in use for decades. They have already incrementally changed use-of-force norms by setting emerging standards for what counts as meaningful human control. As UN discussions drag on with minimal progress, the trend towards autonomizing weapons systems continues. A thought-provoking and urgent book, *Autonomous Weapons Systems and International Norms* provides an in-depth analysis of the normative repercussions of weaponizing artificial intelligence.

Shows German Science Fiction's connections with utopian thought, and how it attempts *Zukunftsbewältigung*: coping with an uncertain but also unwritten future.
