a concentration gradient.

They are passive, and do not require energy;

Active transport is the movement of substances from low to high

concentration, against a concentration gradient.

As it's name suggests, it is an active process, requiring energy.

Both osmosis and diffusion equalize the concentration of two solutions. Both diffusion and osmosis are passive transport processes, which means they do not require any input of extra energy to occur. In both diffusion and osmosis, particles move from an area of higher concentration to one of lower concentration.

Osmosis And

What Is the Difference  
Between Osmosis and  
Diffusion?

Osmosis is a water-specific type of diffusion, where water moves from a high to a low concentration across a selectively-permeable membrane. Larger molecules are transported into and out of the cell by

bottom of the page.

Active transport can be looked at first by

reminding students that diffusion sees molecules move down a

concentrations gradient.

Suggest that there are times when cells need to move molecules up a concentration gradient.

PDF Diffusion

Passive transport is a way that small molecules or ions move across the cell

membrane without input of energy by the cell.

The three main kinds of passive transport are diffusion, osmosis, and facilitated diffusion.

Diffusion is the movement of molecules from an area of high concentration of the
