The will result in the overall volume of air displaced by the engine. For example if we have a bore of 4 inches and a stroke length of 3.52 inches on an 8 cylinder engine, the displacement would be: $\text{Displacement} = (4 \text{ in.}/2) \times (4 \text{ in.}/2) \times 3.1416 \times 3.52 \text{ in.} \times 8 = 353.86 \text{ cubic inches.}$

Displacement is used to calculate the compression ratio of an engine and is used to indicate the size of an engine. The formula to find engine displacement is: displacement = $\pi \times b^2 \times s \times c$. Where b is equal to the bore size, s is equal to the stroke length, and c is the number of cylinders.
