Section 3.6 Examples Example 3.6.1. Balloon. A hot air balloon 30 feet above the ground is tethered by three cables as shown below. If the balloon is pulling upwards with a force of 900 lbs, what is the tension in each of the three cables? The grid lines on the ground plane are spaced 10 feet apart.

A bridge, a communication tower and frame of an automobile all are structures. Mechanisms and machines in static configuration, when the forces are balanced and there is no motion, are also analyzed for force interactions under Statics in Engineering Mechanics. Static mechanisms and machines are analogous to structures for force analysis.

Statics is a branch in mechanics that studies the analysis of of loads on particles in static equilibrium. To put this in simple terms, statics is the study of forces on something that is not moving. The most helpful method to solving statics problems is making sure the sum of the forces equal zero.

Statics is a branch of mechanics which studies the effects and distribution of forces of rigid bodies which are and remain at rest. In this area of mechanics, the body in which forces are acting is assumed to be rigid.The deformation of non-rigid bodies is treated in Strength of Materials.. Examples for Engineering Statics? Hello all! I'm a first year engineering student who is really, REALLY struggling with stuff like bending moments, shear forces and axial forces. Does anyone know where I can find example problems along with answers? (preferably lots).

An engineering application of this concept is determining the tensions of up to three cables under load, for example the forces exerted on each cable of a hoist lifting an object or of guy wires restraining a hot air balloon to the ground. Moment of inertia

Statics is the first volume of a three-volume textbook on Engineering Mechanics. The authors, using a time-honoured straightforward and flexible approach, present the basic concepts and principles of mechanics in the clearest and simplest form possible to advanced undergraduate engineering students of various disciplines and different educational backgrounds.

There are two types of quantities in physics: scalars and vectors. Scalars have only a magnitude, e.g. time, volume, speed, energy, mass, and density. Vector quantities are described by both a magnitude and direction; examples include displacement, velocity, acceleration, force, moment, and momentum. Speed is velocity with its direction component.

Statics is the basis for all other courses in mechanical Engineering. Statics. Statics Deals with the Equilibrium of Bodies, That Is Those That Are Either at Rest or Move with a Constant Velocity. Opposite to what Dynamics Is Concerned with that is the Accelerated Motion of Bodies. Statics is the Prerequisite for dynamics on academic Procedure.

In addition to these, one can also classify a lot of other objects as "structures." The space station Chassis of your car Your chair, table, bookshelf etc. etc. For instance: Almost everything has an internal structure and can be thought of as a "structure". The objective of this chapter is to figure out the forces being carried by these structures so that as an engineer, you can decide whether the structure can sustain these forces or not.

~~Chapter 6: Analysis of Structures - College of Engineering~~

We first discuss Newton's laws and basic concepts of what is a force, vectors, and the dimensions and units involved. Then we consider systems of forces and how to compute their resultants. We discuss the main characteristics of vectors and how to manipulate them. Then the meaning and computation of moments and couples.
