Real Time GPS Fleet Tracking Irrespective of the number of vehicles in your fleet, LocoNav's GPS fleet management software is determined to monitor & protect your asset from theft or harm.

Fleet Management Solutions: Track Your Fleet 24\*7 | #1 ...  
The latest innovation in fleet management solutions is here! RAM Assist delivers a range of digital fleet management tools. Designed to aid Fleet Managers and Business Owners in managing the mobile workforce; the Ram Assist fleet management software app is the perfect pocket assistant for drivers to use.

This book shows how to build a "INFelecPHY GPS Unit" (IEP-GPS) tracking system for fleet management that is based on 3G and GPRS modules. This model should provide reliability since it deals with several protocols: 1) HTTP and HTTPS to navigate, download and upload in real time the information to a web server, 2) FTTP and FTTPS to handle in a non-real time the files to the web application, and 3) SMTP and POP3 to send and receive email directly from the unit in case of any alert. Similar to a mobile device, but without screen for display, it is multifunctional because it links to a GPRS module, a camera, a speaker, headphone, a keypad and screen.

The market for GPS tracking services Is a rapidly growing and relatively untapped opportunity for small businesses and entrepreneurs. Currently there are more than twelve million registered commercial vehicles in the USA alone. In Latin America, there are over 20 million. However, a very small percentage of these vehicles are protected by fleet management software. Fortunately, this has started to change. There are many facets in a GPS car tracking business that are profitable for entrepreneurs (and that's why you should read this guide), including the benefit of recurring revenue from service subscriptions. Before you start your GPS vehicle tracking business, you should consider several steps that will help your company to succeed. Use this guide to walk yourself through some important steps that you must take to launch a successful GPS vehicle tracking business. Finally, In the last chapter of my guide, I introduce a world-class GPS tracking platform provider/vendor that will help you get started, and put your new GPS tracking business on the map. They will ensure you're in business for yourself, but never by yourself. A link to a demo of their GPS tracking software is provided for you so you can learn how their team of GPS experts can start you up in business.

This book shows how to build a "INFelecPHY GPS Unit" (IEP-GPS) tracking system for fleet management that is based on 3G and GPRS modules. This model should provide reliability since it deals with several protocols: 1) HTTP and HTTPS to navigate, download and upload in real time the information to a web server, 2) FTTP and FTTPS to handle in a non-real time the files to the web application, and 3) SMTP and POP3 to send and receive email directly from the unit in case of any alert. They will ensure you're in business for yourself, but never by yourself. A link to a demo of their GPS tracking software is provided for you so you can learn how their team of GPS experts can start you up in business.

A handy resource for beginning, intermediate, or advanced PowerPoint users, this three-panel guide features helpful time-saving hints so that you can get the most out of Microsoft's dynamic presentation software. Written to follow PowerPoint 2010 (and compatible with PowerPoint 2007), this guide includes helpful screen captures and icons, as well as clear and concise instructions.

This book shows how to build a "INFelecPHY GPS Unit" (IEP-GPS) tracking system for fleet management that is based on 3G and GPRS modules. This model should provide reliability since it deals with several protocols: 1) HTTP and HTTPS to navigate, download and upload in real time the information to a web server, 2) FTTP and FTTPS to handle in a non-real time the files to the web application, and 3) SMTP and POP3 to send and receive email directly from the unit in case of any alert. Similar to a mobile device, but without screen for display, it is multifunctional because it links to a GPRS module, a camera, a speaker, headphone, a keypad and screen.

GPS Tracking with Java EE Components: Challenges of Connected Cars highlights how the self-driving car is actually changing the automotive industry, from programing embedded software to hosting services and data crunching, in real time, with really big data. The book analyzes how the challenges of the Self Driving Car (SDC) exceed the limits of a classical GPS Tracking System (GTS.) It provides a guidebook on setting up a tracking system by customizing its components. It also provides an overview of the prototyping and modeling process, and how the reader can modify this process for his or her own software. Every component is introduced in detail and includes a number of design decisions for development. The book introduces Java EE (JEE) Modules, and shows how they can be combined to a customizable GTS, and used as seed components to enrich existing systems with live tracking. The book also explores how to merge tracking and mapping to guide SDCs, and focuses on client server programming to provide useful information. It also discusses the challenges involved with the live coordination of moving cars. This book is designed to aid GTS developers and engineers in the automotive industry. It can also help Java Developers, not only interested in GPS Tracking, but in modern software design from many individual modules. Source code and sample applications will be available on the book's website.

This book is a part of the Proceedings of the Seventh International Symposium on Neural Networks (ISNN 2010), held on June 6-9, 2010 in Shanghai, China. Over the past few years, ISNN has matured into a well-established premier international symposium on neural networks and related fields, with a successful sequence of ISNN series in Dalian (2004), Chongqing (2005), Chengdu (2006), Nanjing (2007), Beijing (2008), and Wuhan (2009). Following the tradition of ISNN series, ISNN 2010 provided a high-level international forum for scientists, engineers, and educators to present the state-of-the-art research in neural networks and related fields, and also discuss the major opportunities and challenges of future neural network research. Over the past decades, the neural network community has witnessed significant breakthroughs and developments from all aspects of neural network research, including theoretical foundations, architectures, and network organizations, modeling and simulation, empirical studies, as well as a wide range of applications across different domains. The recent developments of science and technology, including neuroscience, computer science, cognitive science, nano-technologies and engineering design, among others, has provided significant new understandings and technological solutions to move the neural network research toward the development of complex, large scale, and networked brain-like intelligent systems. This long-term goals can only be achieved with the continuous efforts from the community to seriously investigate various issues on neural networks and related topics.

AVL technology is assisting decision support, situation awareness, and emergency response situations. It is well known that the most critical time factor is the availability of basic information such as the location of an incident, location of emergency resources, distance to a certain location and travel time. Aside from emergency response support, AVL technology provides improved response time, resource management, schedule adherence and increased productivity on a day to day application. The use of this technology can support many activities such as fleet management, snow plow routing, garbage truck tracking, and mobile workforce management. The value of dynamic geospatial information is extremely powerful especially when it is integrated with existing static geospatial information because of the added capability it provides. Knowing where "something" is located as it moves along the earth's surface, gives you the ability to predict, react, and respond accordingly. By having the authority or ability to change the direction of a moving vehicle, certain users are essentially "enabled" to make more efficient use of these valuable resources in real time. In response to a previous accident, Peterson AFB established a satellite based GPS tracking system in 2003. The system was designed to monitor missile transport using GPS, satellite communication and web based mapping capabilities. This same tracking system was later installed on emergency response vehicles to provide the similar capabilities including incident management. The Air Force Academy (AFA) Fire Department was a recipient of this system that was offered to all military installations in the region. Shortly after installation, it was discovered that although the GPS tracking system was efficient for tracking missile transport vehicles, it did not meet Emergency Management response requirements because of the eight to ten minute latency in data transmission. --page 5.
